

# Rooting my Eight Sleep Pod 3

---

adam schaal · clevernnyyy@ · 12.09.2025

# Eight Sleep Problems

## Cloud Dependency

Autopilot depends on the cloud to do the calculations.

## No Local Access

No RJ45 jack, no way to control locally if the internet is down.

## Subscription Model

\$199 (basic) or \$399 (elite) per year to use Eight Sleep's application and autopilot.

# Eight Sleep Pod 3

---

This story starts on the night of October 19th, 2025, when a tired dad went to bed around midnight.

Suddenly at 2:11 AM on the morning of October 20th, **it all went wrong.**

## What is US-East-1? Why AWS Northern Virginia server issues took down half the internet

How Amazon's most important cloud region became critical to daily online life, and why even a brief disruption can have global effects.

Written by **Katie Malone**

OCTOBER 20, 2025

# Whoa!

---

I woke up at 3:15 AM, as **cold as ice**. My Eight Sleep Pod was in cooling mode and just *didn't stop cooling!!*

I was now on the maximum level of cold and I could not turn it off.

## Hot

---

Reports of burns as “heating”  
autopilot went up to 100 degrees

## Cold

---

My autopilot was stuck on  
“cooling” mode and went down  
to 55 degrees

This slide made me think of the classic  
song “Hot and Cold” by Katy Perry.

# Eight Sleep's Response

---

Eight Sleep responded by releasing a feature enabling Bluetooth controls for their Pods shortly after the outage.

# Not Enough for Me, I need my ICP

I

## Independence

---

No longer depend on the Eight Sleep infrastructure.

C

## Customization

---

I wanted the capability to customize my level of service and security as I saw fit.

P

## Peace

---

I wanted the peace of mind knowing my bed won't turn to an oven or a freezer at night if AWS has a bad day.

## Free Sleep — Local Control for 8 Sleep Pods

<https://github.com/throwaway31265/free-sleep/tree/main>

Rooting Eight Sleep for \$70... much better than the \$399 per year I was paying.

Walk-through seemed easy enough and it was reversible if something went wrong.

# Free Sleep Tools

1. **\$50** TC2070-IDC- 14 pin  
Plug-of-Nails programming  
ribbon cable
2. **\$13** FTDI FT232RL- FTDI USB  
to TTL Serial Adapter
3. **\$7** Dupont Wires-  
Breadboard Jumper Cables

# My experience with Free Sleep - Serial

1. VERIFY your current\_slot = a, if not, go back and firmware reset your pod

```
printenv current_slot
```

2. If you have current\_slot=a

```
setenv bootargs "root=PARTLABEL=rootfs_a rootwait init=/bin/bash"  
run bootcmd
```

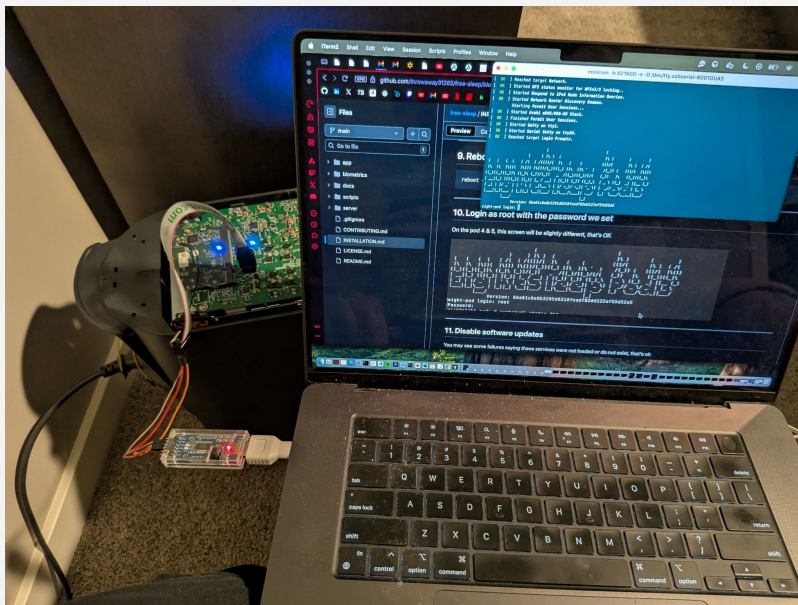

3. Mount the filesystem, then mount the file system in read write mode.

```
mount -t proc proc /proc  
mount -t sysfs sysfs /sys  
mount -t devtmpfs devtmpfs /dev  
mount -t tmpfs tmpfs /run  
mount -o remount,rw /
```

# My experience with Free Sleep - Serial

## 4. Update passwords for root & rewt then sync and reboot

```
passwd root  
passwd rewt  
sync  
reboot -f
```

## Free Sleep also walks you through...

# My experience with Free Sleep - Serial

## Additional Modifications

- Enabling firewall rules to block access to the internet from the linux device.
- Adding ssh config.
- Enabling biometrics.
- Pass through to control via phone application away from home.

# Thanks
